1222

Total Deaths

85

Total Hospitalized

75

All data are extracted from MAVEN and MDPH reporting. Presented data assumes that data sources are current and accurate as of the date they are reported. Case counts include probable cases (antigen and antibody tests) and confirmed cases (molecular tests). Percent positivity is calculated using only positive molecular tests, and does not include antigen or antibody tests.

*Active cases are cases with reported positive results, who are currently in isolation under public health supervision.

**Partially vaccinated individuals have received 1+ doses of COVID-19 vaccine, but have either not received their final dose or have received their final dose less than 14 days ago. Fully vaccinated individuals have received their final dose of the COVID-19 vaccine at least 14 days ago.

***Residential exposure refers to exposure within the home or another congregate setting such as a long-term care facility. External exposure refers to any case that does not have an identifiable source of exposure at their place of residence. This includes individuals who may be linked to clusters in other settings such as social gatherings, athletic events, and workplaces, those who may have had known contact with one or more confirmed cases outside of the home, and those who may have no known source of exposure.
