All data are extracted from MAVEN, MDPH, and vitals statistics reporting. Presented data assumes that data sources are current and accurate as of the date they are reported. Case counts and percent positivity are calculated using only confirmed cases diagnosed with positive molecular tests (eg. PCR), and does not include probable cases tested with antigen or antibody tests. Previous case counts included antigen tests. Case count data is current as of 5/7, and may differ from state data due to the later data extraction date.

*Active cases are cases with reported positive molecular and antigen results, who are currently in isolation under public health supervision.

**Partially vaccinated individuals have received 1+ doses of COVID-19 vaccine, but have either not received their final dose or have received their final dose less than 14 days ago. Fully vaccinated individuals have received their final dose of the COVID-19 vaccine at least 14 days ago.

***Breakthrough cases are individuals who develop COVID-19 infection greater than 14 days after receiving the final dose of their COVID vaccine series (2nd dose of Moderna or Pfizer, or single dose of Janssen vaccine). Individuals must have a positive molecular test (eg. PCR) to be included in the breakthrough case count. Antigen and antibody tests are not included. Click [here](#) for more information about breakthrough cases and infection after vaccination.
